adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWD42 (gil4732114|gb|AF129072:1), a copy-number inducible derivative of plasmid Rl. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coll XL10-Gold (Stratagene) cells and selected for ampicillin resistance."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polynucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polynuclectide kinase. Adaptor oligonuclectides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pNAV2 (gi14732141gb]AF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      USA
                                                                                                                                                                                                                                                                                                                                                                                       ρ
                                                                                                                                                                                                                                                                                                                                                                          purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XLIO-Gold (Stratagene) cells and selected for ampicillin resistance. "

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            308,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was.blunt end-repaired with T4 DNA polymerase and T4 polynucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pNAPA2 (gil473214|gb|AF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     USA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance. **

WPI;

Claim 1; Page 65-66; 76pp; Japanese.

The invention relates to a mouse neutral/alkaline ceramidase and to nucleic acids encoding it. The invention also relates to expression vectors and host cells comprising DNA encoding mouse neutral/alkaline ceramidase, the recombinant production of the ceramidase, an antibody against the ceramidase, and a method for controlling the ceramide content in cells and/or tissues by introducing the gene or its antisense nucleic acid into the cells and/or tissues. The ceramidase can be used as a lipid engineering reagent for studying structure and functions of ceramide as well as developing drugs for diseases associated with ceramide metabolism. The present sequence represents DNA encoding the mature mouse neutral/alkaline ceramidase.

The invention relates to a mouse neutral/alkaline ceramidase and to nucleic acids encoding it. The invention also relates to expression vectors and host cells comprising DNA encoding mouse neutral/alkaline ceramidase, the recombinant production of the ceramidase, an antibody against the ceramidase, and a method for controlling the ceramide content in cells and/or tissues by introducing the gene or its antisense nucleic acid into the cells and/or tissues. The ceramidase can be used as a lipid engineering reagent for studying structure and functions of ceramide metabolism. The present sequence represents a clone encoding mouse neutral/alkaline ceramidase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       neutral/alkaline ceramidase applicable as lipid engineering or studying structure and functions of ceramide as well as gdrugs for diseases associated with ceramide metabolism -

Mammalian neutral/alkaline ceramidase applicable as lipid enginee reagent for studying structure and functions of ceramide as well developing drugs for diseases associated with ceramide metabolism 2000-619079/59

as

Example 6; Page 67-70; 76pp; Japanese

The invention relates to a mouse neutral/alkaline ceramidase and to nucleic acids encoding it. The invention also relates to expression vectors and host cells comprising DNA encoding mouse neutral/alkaline ceramidase, the recombinant production of the ceramidase, an antibody against the ceramidase, and a method for controlling the ceramide content in cells and/or tissues by introducing the gene or its antisense nucleic acid into the cells and/or tissues. The ceramidaes can be used as a lipid engineering reagent for studying structure and functions of ceramide as well as developing drugs for diseases associated with ceramide metabolism. The present sequence represents a clone encoding

                                                                                                                                                                                                                                                                                                                 7-transmembrane G-protein coupled protein receptors (7TM-GPCRs). The present sequence is one such murine 7TM-GPCR coding sequence. The present sequence was derived from stromal stem cells. The present sequence and its corresponding protein are useful in the prevention, diagnosis and treatment of diseases associated with inappropriate 7TM-GPCR expression. 7TM-GPCRs identify specific signalling molecules, to activate an effector-signalling cascade that triggers an intracellular response and eventually a biological effect.
                                                                                                                                                                                                                                                                                                                                                                                                                                                   DNA Sequences encoding 7-transmembrane G-protein coupled protein receptors characteristic of hematopoietic stem cells, useful for treating leukemia -

                                                                                                                                                                                                                                                                                                The present sequence is provided in a specification relating to a protein having a 761 residue amino acid sequence or its variant comprising a replacement, deletion, insertion, addition or reversion of at least one amino acid, but retaining the activity of hydrolysing the acid amide bond between sphingosine and the fatty acid in a ceramide. The protein can be used to treat diseases caused by abnormal cell growth such as cancers.

CC The oligonucleotide libraries are useful for detecting mRNAs from a CC biological sample, in expression profiling studies, in qualitatively or CC quantitatively characterising the corresponding transcriptome, and in CC transcriptomes. The libraries may also be used as specialised mini CC libraries to detect transcripts of a sub-transcriptome under a CC particular biological or pathological state, and so allowing the CC restricular biological or pathological state, and so allowing the CC condition; to detect developmental specific genes such as those genes CC only expressed in specific tissue under a specific pathological condition; to detect developmental specific pathological condition; to detect RNA condition; to detect RNA condition; to detect transcriptome of a patient suffering conditio

The protein can be used to treat diseases caused by abnormal cell growth such as cancers.

                                                                                                                                                                                                                   Query Match
                                                                                                                                                                                                                                                                   inflammation. Ceramidase protein and gene are useful for treating disorders involving deficient cell proliferation or growth e.g. neurodegenerative disorders (Alzheimer's disease), growth deficiencies and lesions. Ceramidase protein is also useful for diagnosis of hyperproliferative diseases. Ceramidase gene can be used as an immunogen to generate antibodies which are useful for diagnosis, prevention and treatment of hyperproliferative diseases and for detecting ceramidase gene product in a biological sample. The hyperproliferative disorders include cancers and autoimmune disorders such as lupus nephritis, glomerular disease. Ceramidase gene is also useful in antisense therapy
                                                                                                                                                                                                                                                                                                                                                                            The present sequence is a cDNA encoding human mitochyndrial ceramidase protein. Ceramidase protein and gene are useful for treating a disease or disorder involving cell over proliferation or sphingolipid signal transduction especially breast cancer, cardiovascular disorder or
                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human mitochondrial ceramidase protein and gene, modulation of which is useful for preventing and treating proliferative discrders e.g. cancer, cardiovascular disease, inflammation and neurodegenerative disorders -

(SHAN-) SHANGHAI BIOWINDOW GENE DEV

Human sialyl:transferase (hST30-1) 11.99 and encoding polynucleotide, used in diagnosis and treatment of malignant tumors, hemopathy, human immunodeficiency virus infection, immunological diseases

cytostatic, virucidal, immunomodulatory, antiinflammatory and haemostatic activity. The protein and encoding polynucleotide are used in diagnosis and treatment of malignant tumour, haemopathy, human immunodeficiency virus (HIV) infection, immunological diseases and various inflammations. The polynucleotide is useful in gene therapy. The invention relates to human sialyl transferase (HST30-1) 11.99 with cytostatic, virucidal, immunomodulatory, antiinflammatory and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a mouse neutral/alkaline ceramidase and to nucleic acids encoding it. The invention also relates to expression vectors and host cells comprising DNA encoding mouse neutral/alkaline ceramidase, the recombinant production of the ceramidase, an antibody against the ceramidase, and a method for controlling the ceramide content in cells and/or tissues by introducing the gene or its antisense nucleic acid into the cells and/or tissues. The ceramidase can be used as a lipid engineering reagent for studying structure and functions of ceramide as well as developing drugs for diseases associated with ceramide metabolism. The present sequence represents a PCR primer used to isolate nucleic acids encoding mouse neutral/alkaline
                                            New nucleic acid that is a 5' expressed sequence tag (5' EST) for obtaining cDNAs and genomic DNAs that correspond to 5'ESTs and for diagnostic, forensic, gene therapy and chromosome mapping procedures

An ORF has been identified within the sequence. The 5' ESTs were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed cDNA libraries. Such ESTs are not well suited for isolating cDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer cDNA sequences have been obtained, the full 5' UTR is rarely included. 5' ESTs are derived from mRNAs with intact 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs 5' ESTs are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design expression and secretion

The gene number is given in the descriptor line. The gene can be used to generate fusion proteins by linking to the gene to a human immunoglobulin Fc portion (e.g. AA;06210) for increasing the stability of the fused protein as compared to the human protein only. The invention relates to 36 novel genes and their fragments (nucleic acid sequences: AAZ06219-Z06263; amino acid sequences AAX38386-Y38498) which are useful for preventing, treating or immeliorating medical conditions e.g. by protein or gene therapy. Also, pathological conditions can be diagnosed by determining the amount of the new polynucleotides. Specific uses are described for each of the 36 polynucleotides, based on which tissues they are most highly expressed increase and assemble or by determining the presence of mutations in the new polynucleotides. Specific uses are described for each of the 36 polynucleotides, based on which tissues they are most highly expressed in the new polynucleotides.
                    The present sequence is a PCR primer used for cloning human mitochondrial ceramidase DNA. Ceramidase protein and gene are useful for treating a disease or disorder involving cell over proliferation or sphingolipid signal transduction especially breast cancer, cardiovascular disorder or inflammation. Ceramidase protein and gene are useful for treating disorders involving deficient cell proliferation or growth e.g. neurodegenerative disorders (Alzheimer's disease), growth deficiencies and lesions. Ceramidase protein is also useful for diagnosis of brown of the control of 
                                                                                                                                                                                                                                                                                                                             Human mitochondrial ceramidase protein and gene, modulation of which is useful for preventing and treating proliferative disorders e.g. cancer, cardiovascular disease, inflammation and neurodegenerative disorders -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                gene therapy; proliferative disorder; cancer; cardiovascular disease; inflammation; neurodegenerative disorder; cytostatic; immunosuppressive; nootropic; signal transduction; breast cancer; autoimmune disorder; Alzheimer's disease; growth deficiency; lesion; lupus nephritis; glomerular disease; PCR primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Hannun
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        02-AUG

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        nucleic acids encoding it. The invention also relates to expression vectors and host cells comprising DNA encoding mouse neutral/alkaline ceramidase, the recombinant production of the ceramidase, an antibody against the ceramidase, and a method for controlling the ceramide content in cells and/or tissues by introducing the gene or its antisense nucleic acid into the cells and/or tissues. The ceramidase can be used as a lipid engineering reagent for studying structure and functions of ceramide as well as developing drugs for diseases associated with ceramide metabolism. The present sequence represents a PCR primer used to amplify nucleic acids encoding mouse neutral/alkaline ceramidase.

                                                                                                                                                                                                                                              identifying individuals having a certain phenotype, determining the presence or absence of genetic markers associated with the phenotype, and instituting a lifestyle change to exploit or counteract the phenotype expressed by the gene marker. If the phenotype is hypertension, the gene marker is at least one insertion (I) ACE allele and exercise training is instituted to decrease systolic and diastolic blood pressure. The gene marker can be identified by PCR amplification (see AAV41321-22) of the appropriate gene region. The general method can be used to identify subjects who will benefit most from physical exercise and also to identify those who are likely to be successful in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This is the human angiotensin converting enzyme (ACE) gene. The gene is polymorphic with 2 common alleles (I and D), resulting in 3 genotypes, II, ID and DD. It is an object of the invention to identify individuals possessing a certain genotype and associated ailment, and to determine if the health of that individual can be improved by altering behavior. A claimed method comprises
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Analysis of genetic markers to identify subjects who will benefit from exercise - also assessing risk of cardiovascular disease from angiotensin-converting enzyme genotype

CC Fragments of the genes comprising a polymorphic site may be used as Clibrary arrays for high throughput screening. The genes, and the proteins CC library arrays for high throughput screening. The genes, and the proteins CC drugs betermination of an individual's polymorphic pattern reduces or CC eliminates trial and error in selecting a treatment for a particular CC individual cardiovascular patient. It also provides the ability to CC eliminate patients from clinical trials who are predicted to be non-responsive, or at a risk for an adverse response, to a particular CC identify polymorphic patterns so that the adverse results can be evaluated to cidentify polymorphic patterns so that the adverse results can be can be correlated with a sub-population of the test population, permitting carcal such such sub-population of the test population, thereby CC curse and the duration and cost of such trials. Sequences A38328 and CC assays of the duration and cost of such trials. Sequences A3828 and CC assays of the population and cost of such trials. Sequences A3828 and CC identified are 375A/C, 582C/T, 731A/G, 1060C/A, 1315C/T, 2193C/A, 1320-7m, add addetion of constant of the polymorphic sites identified are 375A/C, 582C/T, 731A/G, 1060C/A, 1315C/T, 2193C/A.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           genes encoding angiotensin converting enzyme (ACE), angiotensin II receptor type 1 (AT1) and type 2 (AT2), angiotensinogen (AGT), renin, aldosterone synthase, endothelin receptor type A and beta-adrenergic receptors 1 and 2. The method comprises determining the sequence at one or more polymorphic positions within these genes, and comparing the pattern of polymorphisms from the individual with a reference polymorphic pattern obtained from a population of individual exhibiting a predetermined cardiovascular disease status. The polymorphic markers are useful for determining the predisposition of an individual to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              cardiovascular disorders such as myocardial infarction, unstable angina hypertension, atherosclerosis and stroke. They are also useful for predicting the likely cardiovascular status of a patient given a treatment regimen comprising administration of cardiovascular drugs (e.g., ACE inhibitors, beta-adrenergic receptor antagonists (beta-blockers) or calculum channel blockers). One or more polymorphic markers provides a basis for predicting the outcome of a treatment regimen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            drug
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Assessing cardiovascular status in humans involves comparing test polymorphic pattern comprising polymorphic positions within genes encoding specific proteins, with reference polymorphic pattern -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        WPI;

The invention relates to a transgenic fly whose genome comprises DNA encoding a polypeptide having the Abeta portion of human amyloid precursor protein (APP), fused to a signal sequence. The DNA sequence encodes a 123 (Abeta40) or 129 (Abeta42) amino acid sequence, given in the specification. The DNA sequence is operably linked to a tissue-specific expression control sequence. Expression of the sequence gives the fly an altered phenotype. The purpose of the invention is for identifying agents that inhibit or promote the expression and/or function of genes or encoded polypeptides which modify the APP pathway. The agent is a compound, triple helix DNA, antisense oligonucleotide, double stranded RNA molecule, ribozyme, or particularly an antibody. It is used to treat conditions such as Alzheimer's disease. The agent can be used as an APP pathway modulator or in gene therapy. This polynucleotide sequence represents the DNA of the APP related human homologue hCP51674.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 4020 BP; 857

In the mature protein the 29 amino acid signal peptide is absent. ACE hydrolyses angiotensin I and/or kinins, most notably bradykinin. Vectors contg. the given sequence are used to produce ACE for therapeutic use eg to hydrolyse kinins implicated in
